

ABSTRACT

A remote control system is provided for producing a secondary on screen display (OSD). The secondary OSD is produced by a display device of a remote control unit. The remote control unit includes a remote receiver responsive to the OSD function parameters of an operably linked electronic device. A data processor generates a secondary on-screen display in response to the received OSD function parameters. A display operably linked to the data processor for displaying a menu corresponding to the received OSD parameters. A transmitter for providing a control parameter corresponding to a menu selection from the remote control unit to the electronic device.
